

RSM Metrics Usage instructions

1. Install the program from the website.
2. Start the program by clicking the appropriate icon.
3. On the main window, select “Choose or modify files.” This item will let you select the files that you will be analyzing.
4. Press the clear tree button to clear the source tree.
5. On the input file list, press the clear button to clear any existing files that may be in the list.
6. Browse to the directory which contains your code and select it using the set path button
7. Click “Acquire files” to acquire the files in your project.
8. Click on the “Files to List” to add the files to the list of files that are being measured.
9. Click on the Load or name output file to set the output filename and destination path using the set button.
10. Click on the execute RSM and the Execute button to run the tool. This will generate an html summary file with line of code counts.
11. Using the info at <http://msquaredtechnologies.com/m2rsm/docs/index.htm>, interpret the report as is necessary.
