

# Procedures

Methods

## Lecture Objectives:

- 1) Define procedure -
- 2) Explain the MIPS calling convention for procedure calls -
- 3) Define the term program counter  $\Rightarrow$  (PC)
- 4) Explain the relationship between the caller and callee in a procedure call
- 5) Explain the purpose for the stack when invoking procedures
- 6) Explain the relationship between characters and strings.
- 7) Explain the three main mechanisms for representing strings in memory. *May not cover today*
- 8) ~~Explain the relationship between the 5 MIPS addressing modes.~~

# Compare and contrast: What is different here?

```
Public static void main(String[] args)
{
  for (int x = 0; x < 10; x++)
  {
    System.out.println(x);
  }
}
```

*call a procedure*

*Does not have an extra method*

```
Public static void main(String[] args)
{
  for (int x = 0; x < 10; x++)
  {
    printit(x);
  }
}
```

```
Public static void printit(int number)
{
  System.out.println(number);
}
```

*go here and return @ end*

*New method.*

*Procedure: Going to another segment of code.*

# Definitions

- Procedure - *Java Method*
  - A stored subroutine that performs a specific task based on the parameters which it is provided
- Return address → *where in memory to go back!*
  - A link to the calling site that allows a procedure to return to the proper location once it is completed.
- Program counter *representation*
  - The register containing the address of the instruction in the program being executed ⇒ *current instruction*
- Stack *storing copies of data*
  - A data structure for spilling registers organized as a last in first out queue
- Stack pointer *but we need a key*
  - A value denoting the most recently allocated address in a stack that shows where registers should be spilled or where registers can be found → *top of the stack*
- Push
  - Add an element to the stack
- Pop
  - Remove an element from the stack.

# Procedure Calling

Local Variables

Do the code

Go back

drawLine(100, 200);  
          ↑          ↑  
          Parameters

- Steps required
  1. Place parameters in registers
  2. Transfer control to procedure
  3. Acquire storage for procedure
  4. Perform procedure's operations
  5. Place result in register for caller
  6. Return to place of call

call the procedure

return value in register

parameters →

For MIPS Register Usage

- \$a0 – \$a3: arguments (reg's 4 – 7)
- \$v0, \$v1: result values (reg's 2 and 3)
- \$t0 – \$t9: temporaries
  - Can be overwritten by callee
- \$s0 – \$s7: saved
  - Must be saved/restored by callee
- \$gp: global pointer for static data (reg 28)
- \$sp: stack pointer (reg 29)
- \$fp: frame pointer (reg 30)
- \$ra: return address (reg 31)

things to pay attention to.

points to top of stack

Where we go back to.

Calling a method

Two instructions  
to keep track of.

# Procedure Call Instructions

- Procedure call: jump and link *to call a piece of code*  
jal ProcedureLabel
  - Address of following instruction put in \$ra
  - Jumps to target address

- Procedure return: jump register  
jr \$ra *Go back*
  - Copies \$ra to program counter
  - Can also be used for computed jumps
    - e.g., for case/switch statements

*Label in code  
Name of the procedure.*

*Later on*

# Lets look at an example

## (Java Code First)

```
public static void main(String[] args)
{
    Scanner s = new Scanner(System.in);
    System.out.println("Enter x:");
    Int x = s.nextInt();
    System.out.println("Enter y:");
    Int y = s.nextInt();
    analyze(x, y);
}
public static void analyze(int x, int y)
{
    if (x > y)
    {
        System.out.println("X was greater than Y.");
    }
    else
    {
        System.out.println("Y was greater than X.");
    }
}
}
```
