

Software Quality Assurance Software Reliability Engineering

Objectives

- Define the relationship between reliability and availability
- Explain how one can quantify the relationship between failures
- ·List the tradeoffs in major software quality characteristics
- Explain the Software Reliability Engineering process
- •Explain how one determines the appropriate reliability level
- Describe how one performs testing using an operational profile.

Must it be

Reliability Software

statistical measure for the operation of a software system without a failure occurring

- Software reliability is a measure for the probability of a software failure occurring during the time interval
- Two terms related to software reliability
 - Fault: a defect in the software, e.g. a bug in the code which may cause a failure

Failure: a derivation of the programs observed behavior from the required behavior

Software Availability

- Measure of how likely the system is available for use. Takes repair/restart time into account
- Availability of 0.998 means software is available for 998 out of 1000 time units
- Relevant for continuously running systems
 - telephone switching systems

Software Reliability Engineering

Dec 15,2015

Base product -

- Major variations of base product (for substantially different environments, platforms, or configurations)
- Frequently used supersystems of base product or variations

Prikot Family

Determining the "right"

- Define what you mean by failure.
- Choose a common reference unit for all failures
- Set system failure intensity for each associated system
- Measure the results

Whitis a failure!

Failure Severity Classes

	Failure Severity Class	System Capability	Example
)	1	Basic Service interruption	Containes
	2	Basic service degradation /// Inconvenience, correction can not be	SUNchakout
	3	Inconvenience, correction can not be deferred	but suller on sid
	4	Minor tolerable effects, correction deferrable	SUN is SLOW,

Failure Severity Classes

Failure Severity Class	System Capability	Example
1	Basic Service interruption	Calls misforwarded or not forwarded
2	Basic service degradation	Phone number entry inoperable
3	Inconvenience, correction can not be deferred	Graphical User interface for administrators inoperable
4	Minor tolerable effects, correction deferrable	Date missing from display

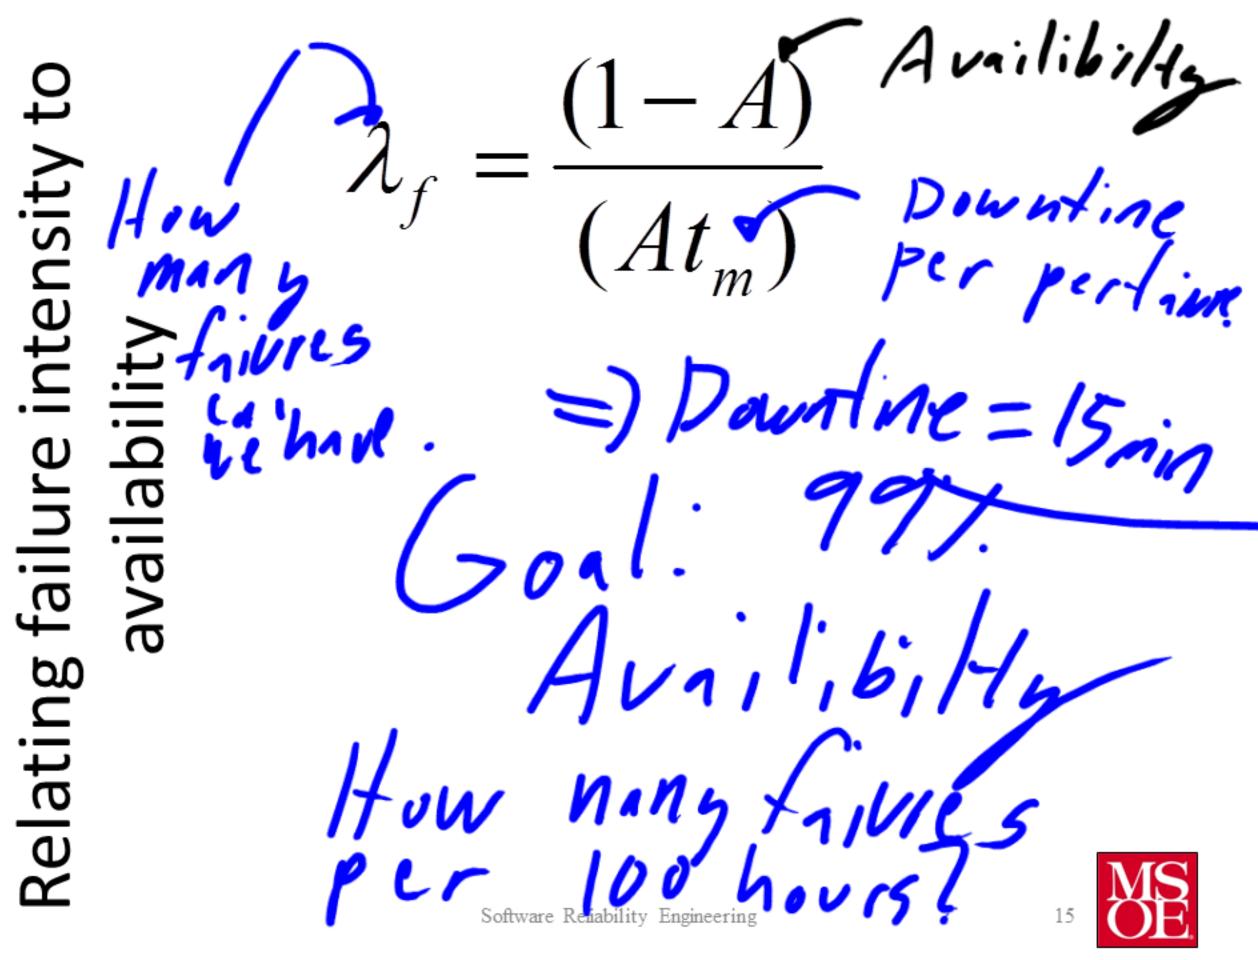

Another assessment of

intensit∖

Cost of failre in

Failure Impact	Typical Failure intensity objective (failures / hour)	Time Between failures
Hundreds of deaths, more than \$10 ⁹ cost	10 ⁻⁹	114,000 years
One death, around \$10 ⁶ cost	10-6	114 years
Around \$1000 cost	10 -3	6 weeks
Around \$100 cost	10-2	100 hours
Around \$10 cost	10-1	10 hours
Around \$1 cost	1	1 hour

ಹ

Relating failure intensity to

$$\lambda_f = \frac{1 - 1}{At}$$
Spility to the intensity to the policy of the intensity of the intens

$$\lambda_f = \frac{(1-A)}{(At)}$$

Converting failure intensity

$$R = e^{(-\lambda t)}$$

if $\lambda t < 0.05$

 $R \approx 1 - \lambda t$

T time of He mission.

16

Converting reliability to failure intensity

$$\lambda = \frac{-\ln R}{t}$$
if $\lambda t < 0.05$

$$\lambda \approx \frac{(1-R)}{t}$$

our tests Preparing

- Determine the number of test cases for the system
 - Allocate them equally across the system in proportion to the occurrence rate of the system
 - Make certain each test has a minimum of one, adjusting total number as is necessary

18

- Lets make the following assumptions:
 - It takes 1 hour to design and run a test
 - 5% of tests result in a failure
 - 4 hours are spent correcting each fault
 - Test budget is 1000 hours
 - How many tests do we create?

Preparing our Tests

Operation	Occurrence Probability	Initial Test Case Count
Proc. Voice call, no pager, ans.	0.21	8334.21
Process voice call, pager, ans.	0.19	833×.19
Proc. Fax call	0.17	
Proc Voice call, pager answer on page	0.13	
Proc. Voice call, no pager, no answer	0.10
